9. Cardiovascular Diseases

Reference

1. Objectives
To evaluate the effectiveness of treatment with electroacupuncture on upper-extremity spasticity in stroke patients.

2. Design
Randomized controlled trial (RCT).

3. Setting
One Oriental hospital (details not mentioned), Republic of Korea.

4. Participants
Hemiplegic patients with upper-extremity spasticity after stroke (n=20).

5. Intervention
Arm 1: Conservative therapy + electroacupuncture treatment (5 rounds per week for 2 weeks, total 10 rounds, acupuncture for 20 minutes at the Quze (P3, 曲澤), Tianquan (PC2, 天泉), Neiguan (PC6, 内關), and Chize (LU5, 尺澤) acupuncture points; n=10).
Arm 2: Conservative therapy only (n=10).
Two subjects in Arm 2 dropped out during the study.

6. Main outcome measures
Score on the Modified Ashworth Scale (MAS), Fugl-Meyer Assessment (FAM), and H-reflex/M-response (H/M ratio).

7. Main results
1) There was no significant between-group difference in MAS.
2) FMA showed a tendency toward improvement in Arm 1 compared to Arm 2.
3) H/M ratio was significantly decreased after 2 hours in Arm 1 (−34.1±34.4 vs. −54.5±31.2 in Arm 2, \( P=0.006 \)).

8. Conclusions
Electroacupuncture is effective for decreasing spasticity and improving functional recovery.

9. Safety assessment in the article
Not mentioned.

10. Abstractor’s comments
This study evaluated the effectiveness of electroacupuncture for upper-extremity spasticity due to stroke. H/M ratio was the only quantitative measure to show significant between-group differences. As the number of subjects were small and evaluation period was short, there is a need for additional clinical trials.
